Maxima Reference Guide:

Guide to Simulation and Modeling for Biosciences David J. Barnes, Dominique Chu, 2015-09-01 This accessible text presents a detailed introduction to the use of a wide range of software tools and modeling environments for use in the biosciences as well as the fundamental mathematical background. The practical constraints presented by each modeling technique are described in detail enabling the researcher to determine which software package would be most useful for a particular problem. Features introduces a basic array of techniques to formulate models of biological systems and to solve them. Discusses agent based models, stochastic modeling techniques, differential equations, spatial simulations and Gillespie's stochastic simulation algorithm. Provides exercises, describes such useful tools as the Maxima algebra system, the PRISM model checker and the modeling environments Repast Simphony and Smoldyn. Contains appendices on rules of differentiation and integration, Maxima and PRISM notation and some additional mathematical concepts. Offers supplementary material at an associated website.

Introduction to Modeling for Biosciences David J. Barnes, Dominique Chu, 2010-07-23 Mathematical modeling can be a useful tool for researchers in the biological sciences. Yet in biological modeling there is no one modeling technique that is suitable for all problems. Instead different problems call for different approaches. Furthermore it can be helpful to analyze the same system using a variety of approaches to be able to exploit the advantages and drawbacks of each. In practice it is often unclear which modeling approaches will be most suitable for a particular biological question a problem which requires researchers to know a reasonable amount about a number of techniques rather than become experts on a single one. Introduction to Modeling for Biosciences addresses this issue by presenting a broad overview of the most important techniques used to model biological systems. In addition to providing an introduction into the use of a wide range of software tools and modeling environments this helpful text reference describes the constraints and difficulties that each modeling technique presents in practice enabling the researcher to quickly determine which software package would be most useful for their particular problem. Topics and features introduces a basic array of techniques to formulate models of biological systems and to solve them intersperses the text with exercises throughout the book includes practical introductions to the Maxima computer algebra system, the PRISM model checker and the Repast Simphony agent modeling environment. Discusses agent based models, stochastic modeling techniques, differential equations and Gillespie's stochastic simulation algorithm. Contains appendices on Repast batch running, rules of differentiation and integration, Maxima and PRISM notation and some additional mathematical concepts. Supplies source code for many of the example models discussed at the associated website <http://www.cs.kent.ac.uk/imb>. This unique and practical guide leads the novice modeler through realistic and concrete modeling projects highlighting and commenting on the process of abstracting the real system into a model. Students and active researchers in the biosciences will also benefit from the discussions of the high quality tried and tested modeling tools.

Williams,Charles J. Fagg,1921 **Heavy Tailed Functional Time Series** Thomas Meinguet,2010-08 The goal of this thesis is to treat the temporal tail dependence and the cross sectional tail dependence of heavy tailed functional time series

Functional time series are aimed at modelling spatio temporal phenomena for instance rain temperature pollution on a given geographical area with temporally dependent observations Heavy tails mean that the series can exhibit much higher spikes than with Gaussian distributions for instance In such cases second moments cannot be assumed to exist violating the basic assumption in standard functional data analysis based on the sequence of autocovariance operators As for random variables regular variation provides the mathematical backbone for a coherent theory of extreme values The main tools introduced in this thesis for a regularly varying functional time series are its tail process and its spectral process These objects capture all the aspects of the probability distribution of extreme values jointly over time and space The development of the tail and spectral process for heavy tailed functional time series is followed by three theoretical applications The first application is a characterization of a variety of indices and objects describing the extremal behavior of the series the extremal index tail dependence coefficients the extremogram and the point process of extremes The second is the computation of an explicit expression of the tail and spectral processes for heavy tailed linear functional time series The third and final application is the introduction and the study of a model for the spatio temporal dependence for functional time series called maxima of moving maxima of continuous functions CM3 processes with the development of an estimation method
