**Fractal Apertures in Waveguides, Conducting Screens and Cavities** Basudeb Ghosh, Sachendra N. Sinha, M. V. Kartikeyan, 2014-06-12 This book deals with the design and analysis of fractal apertures in waveguides, conducting screens and cavities using numerical electromagnetics and field solvers. The aim is to obtain design solutions with improved accuracy for a wide range of applications. To achieve this goal, a few diverse problems are considered. The book is organized with adequate space dedicated for the design and analysis of fractal apertures in waveguides, conducting screens and cavities, microwave, millimeter wave applications, followed by detailed case study problems to infuse better insight and understanding of the subject. Finally, summaries and suggestions are given for future work. Fractal geometries were widely used in electromagnetics specifically for antennas and frequency selective surfaces (FSS). The self-similarity of fractal geometry gives rise to a multiband response whereas the space filling nature of the fractal geometries makes it an efficient element in antenna and FSS unit cell miniaturization. Until now, no efforts were made to study the behavior of these fractal geometries for aperture coupling problems. The aperture coupling problem is an important boundary value problem in electromagnetics and is used in waveguide filters and power dividers, slotted ground planes, frequency selective surfaces, and metamaterials. The present book is intended to initiate a study of the characteristics of fractal apertures in waveguides, conducting screens and cavities. To perform a unified analysis of these entirely dissimilar problems, the generalized network formulation of the aperture problems by Mautz and Harrington was extended to multiple aperture geometry. The authors consider the problem of coupling between two arbitrary regions coupled together via multiple apertures of arbitrary shape. MATLAB codes were developed for the problems and validated with the results available in the literature as well as through simulations on ANSOFT's HFSS.

McKnight,2009 ABSTRACT In this thesis a cavity backed slot antenna array is designed for relatively wide instantaneous bandwidth high gain and low sidelobes The array consists of four rectangular slot elements arranged side by side in a linear array and developed around 5GHz Two feed points at opposing sides of the printed array each excite two of the slot elements through a series feed This bidirectional feed presents symmetry to the design and prevents the tendency of beam drift versus frequency as is common with many series fed arrays While being fed in phase the array will maintain boresight at broadside over the entire operating bandwidth Also the additional port allows for the potential introduction of a phase offset and therefore beam tilt Finally the printed array is designed to function within a quarter wave metallic cavity to achieve unidirectional radiation and improve gain      **The Rectangular Cavity Slot Antenna With Homogeneous Isotropic Loading** A.
