

HOMEOSTASIS AND EXERCISE LAB

Background:

Your body's temperature, heart rate, and blood pressure need to remain within certain ranges. In this lab, you will work in groups to examine the effects of exercise on the circulatory and respiratory systems, and on perspiration level. You will then observe how the body reacts when exercise is stopped.

Problem:

How does exercise affect a person's heart rate, breathing rate, and perspiration level?

Hypothesis:

Write a hypothesis about the effect of exercise on the dependent variable that you will be measuring, giving a possible explanation to the problem listed above, using your own knowledge of the body. (You may read the procedure first, to gain a better understanding.)

Materials:

- You, plus two other group members
- A clock or stopwatch/stopwatch app

Procedure:

1. Choose one volunteer to act as the subject --- (pick out a person that can be maintained for eight minutes (just choose right now; don't worry about the timing part). Make sure the volunteer is inactive for a few minutes before the experiment begins.

2. Measure the heart rate by taking his or her pulse; you can do this one of two ways.

1) Radial Pulse: This is probably what we're most familiar with when visiting the doctor's office. Take two fingers (usually the 1st and 2nd finger, and place them in the groove in the wrist that lies beneath the thumb. Move your fingers back and forth gently until you can feel a slight pulsation -- this is the pulse of the radial artery which delivers blood to the hand. Don't press too hard, or else you'll just feel the blood flowing through your fingers!

2) Carotid Pulse: The carotid arteries supply blood to the head and neck. You can feel the pulse of the common carotid artery by taking the same two fingers and running them along the outer edge of your trachea (windpipe). This pulse may be easier to find than the radial artery. Since the carotid arteries supply a lot of the blood to the brain, it's important not to press on both of them at the same time!
