

Microcontact Printing Development of Thiolated Glycosaminoglycans

It is shown that cells interact with glycosaminoglycans (GAGs) to regulate their own growth, adhesion and motility. Fibroblast seeding on immobilized hyaluronic acid derivatives upon amino and vinyl terminated surfaces reveal such mechanism. Additionally, *in vitro* cell dynamics depend on surface chemistry and topography which also influence biocompatibility. The purpose of this work is to develop a microcontact printing approach to immobilize patterns of thiolated hyaluronic acid (t-HA) and thiolated chondroitin sulphate (t-CS) upon vinyl terminated glass by means of a functionalized elastomeric stamp (PDMS; polydimethylsiloxane); printing of native hyaluronic (HA) on amino terminated glass is also included.

Microcontact Printing Development Of Thiolated Glycosaminoglycans Pdms Wetting Properties:

Development of an Inking System for Continuous Roll-to-roll Microcontact Printing of Hexadecanethiol (HDT) on Gold-coated PET Christopher A. Merian, 2016 Microcontact printing is a form of soft lithography that employs a molded polymer stamp to print substrates with pattern features as small as the sub micron range. This is traditionally a plate to plate printing process employing both flat stamps and flat rigid substrates. However, to utilize this patterning technique in a truly low cost manner it must evolve to a scalable roll to roll process. This combination of high precision patterning with high throughput manufacturing techniques could both reduce cost of current products as well as enable a range of new technologies. Large area high rate continuous microcontact printing could be used to make flexible displays, photovoltaic dust sensors and large area sensors among other products. This work describes the development of an inking system to enable continuous roll to roll microcontact printing on a lab scale machine. The molecular ink hexadecanethiol (HDT) is used to print self assembling monolayers (SAMs) on flexible gold coated PET substrate. An ink tank and dryer system are designed and built to enable this material combination to be printed in a continuous manner. Measurement of print quality and pattern replication is executed to confirm that the system performs suitably at high throughput. The employment of the inking system facilitates a continuous roll to roll microcontact printing process which can be used to further develop this manufacturing strategy.
