

SC-7SI

MA-9SI

Multi-channel audio has come of age and Super Audio is the standard. We have produced the SC-7SI, a new control amplifier inspired by the legendary Model 7, which long enjoyed a pre-eminence in the ultimate performance in its class. The capabilities of the SC-7SI are enhanced because of the unique competence of modern technology.

Model 7

Inspired by 1940's tube vacuum control amplifiers developed for use by government and science, the Model 7, known as the 'Warren', was the first to offer the ultimate in performance. The vacuum tubes, hand built, were included for every component to all make the system available at that time. The philosophy behind the vacuum design and the optical connection to every component, which is still used after more than 50 years, justifying our confidence.

The power indicator is based on the tradition of the legendary Marantz brand. The MA-9SI is the ultimate vacuum power amplifier for driving even the most demanding speakers with absolute ease. It represents the perfect balance between new age interpretation and traditional quality and carries that new power dimension of the enhanced Model 9 line on the MA-9SI.

Model 9

The vacuum power amplifier, developed in 1940, reached 1000 watts in an effort to provide greater dynamic range at possibly high volume power, which became the ultimate in vacuum technology. The vacuum design is still used to carry on in those grand, when has become the standard for the best in vacuum power amplifiers.

Encoding and Navigating Linguistic Representations in Memory Claudia Felser, Colin Phillips, Matthew Wagers, 2017-03-22. Successful speaking and understanding requires mechanisms for reliably encoding structured linguistic representations in memory and for effectively accessing information in those representations later. Studying the time course of real time linguistic dependency formation provides a valuable tool for uncovering the cognitive and neural basis of these mechanisms. This volume draws together multiple perspectives on encoding and navigating structured linguistic representations to highlight important empirical insights and to identify key priorities for new research in this area.

Contemporary Morphological Theories Thomas W Stewart, 2015-11-16. In spite of the central position that the concept word has among the basic units of language structure there is no consensus as to the

definition of this concept or network of related concepts Many perspectives are needed in order to gain even a schematic idea of what words are how words may be composed and what relationships there might be between words Many linguists have put forward frameworks for describing the domain of morphology each framework proceeding from its author's assumptions prioritizing distinct formal and functional dimensions and therefore entering into de facto competition This book addresses the needs of the language scholar student who finds her himself engaged in morphological analysis and theorizing It offers a guide to existing approaches revealing how they can either complement or compete with each other

Phonology in the Bilingual and Bidialectal Lexicon Isabelle Darcy, Annie Tremblay, Miquel Simonet, 2017-07-06 A conversation between two people can only take place if the words intended by each speaker are successfully recognized Spoken word recognition is at the heart of language comprehension This automatic and smooth process remains a challenge for models of spoken word recognition Both the process of mapping the speech signal onto stored representations for words and the format of the representation themselves are subject to debate So far existing research on the nature of spoken word representations has focused mainly on native speakers The picture becomes even more complex when looking at spoken word recognition in a second language Given that most of the world's speakers know and use more than one language it is crucial to reach a more precise understanding of how bilingual and multilingual individuals encode spoken words in the mental lexicon and why spoken word recognition is more difficult in a second language than in the native language Current models of native spoken word recognition operate under two assumptions i that listeners perception of the incoming speech signal is optimal and ii that listeners lexical

representations are accurate As a result lexical representations are easily activated and intended words are successfully recognized However these assumptions are compromised when applied to a later learned second language For a variety of reasons e g phonetic phonological orthographic second language users may not perceive the speech signal optimally and they may still be refining the motor routines needed for articulation Accordingly their lexical representations may differ from those of native speakers which may in turn inhibit their selection of the intended word forms Second language users also have to solve a larger selection challenge having words in more than one language to choose from Thus for second language users the links between perception lexical representations orthography and production are all but clear Even for simultaneous bilinguals important questions remain about the specificity and interdependence of their lexical representations and the factors influencing cross language word activation This Frontiers Research Topic seeks to further our understanding of the factors that determine how multilinguals recognize and encode spoken words in the mental lexicon with a focus on the mapping between the input and lexical representations and on the quality of lexical representations
