varies **Alphard: Form and Content** Mary Shaw, 2012-12-06 Alphard is a design for a programming system that supports the abstraction and verification techniques required by modern programming methodology During the language design process we were concerned simultaneously with problems of methodology correctness and efficiency Methodological

concerns are addressed through facilities for defining new task specific abstractions that capture complex notions in terms of their intended properties without explicating them in terms of specific low level implementations Techniques for verifying certain properties of these programs address the correctness concerns Finally the language has been designed to permit compilation to efficient object code Although a compiler was not implemented the research shed light on specification issues and on programming methodology an abstraction specifying its behavior Alphard language constructs allow a programmer to isolate publicly while localizing knowledge about its implementation The verification of such an abstraction consists of showing that its implementation behaves in accordance with the public specification Given such a verification the abstraction may be used with confidence to construct higher level more abstract programs The most common kind of abstraction in Alphard corresponds to what is now called an abstract data type An abstract data type comprises a set of values for elements of the type and a set of operations on those values A new language construct the form provides a way to encapsulate the definitions of data structures and operations in such a way that only public information could be accessed by the rest of the program
