Stand types e.g. plantations derived from seedlings or from clonally generated materials can be compared in terms of average total merchantable volume of timber per acre at time of harvest and/or by average proportions of surviving trees. Average stand yields in the presence of beetles can also be compared with those when beetles are absent thus providing a basis for estimating the real cost of beetle damage in loblolly stands. In this Documentation we briefly describe the model then outline the concepts and structure upon which the SPBLOB simulation source code is based. The included User Guides specify the input information regarding a loblolly stand and its environment required to run two executable Simulation Codes.
