

# How to Secure a Network with Linux

Securing a network with Linux involves knowing techniques for how to:

- Secure network services.
- Prevent information leakage.
- Test for open ports and perform port scans
- Manage Xinetd security.
- Secure SSH
- Configure local Linux firewalls.

## Securing Network Services

What are Network Services

- Network services are sometimes called daemons (a program that runs continuously and exists for the purpose of handling periodic service requests).
  - Listen on network ports for incoming connections
  - Often the focal point of system attacks.
- Constantly running in the background.
- Output recorded in log files.
  - Not connected to a terminal
  - Some use var system log files
  - Some use their own log files
  - Check the config files
- Designed to perform a single task.

How to Secure Network Services

- Use a dedicated user for each service.
  - Take advantage of privilege separation. If an account gets exploited, it can only impact a single service.
  - Do not run services as root
- Ports below 1024 are privileged.
  - Require superuser privileges to open.
  - Use root to open them, then drop privileges.
  - Configuration controlled by each service.
